

Searching for a needle in a haystack - how SDMX IM can improve searching through economic data

29/10/2023

Zlatina Hofmeister, Gabor Horvath, Federica Marcon European Central Bank

New search engine initiative

How to go from this...

... to this

The new ECB Data Portal

- EDP → key dissemination channel for ECB statistics Primary source of data & metadata for end users
- Fully designed based on the SDMX information model (SDMX IM)
- Access the public SDW via: https://data.ecb.europa.eu/

EDP and SDMX IM

Artefacts of the SDMX information model	Corresponding implementation in EDP
Concept scheme	Navigation hierarchy
Data Flow	Data Structure Identifiers
Data Structure Definition	SDW presentation of the series with their dimensions (series key)
Code list	Filters
Cross sectional code list	Filters –dependence of common dimensions across datasets
Metadata	Metadata-reference/structural
Provision Agreement	Provision Agreement – part of the metadata
Data provider	Data provider – part of metadata

Time series disseminated in EDP

	changing composition)	Jan 1997 to Sep 202
Neither seasonally nor		4.3 (Sep 2023
		Percentage chang

More geographical area	6 ~ ·	ICP.M.U2.N.000000.4.AN

- Defined based on existing data structure definition (that includes dimensions and attributes)
- Uniquely represented by its dimensions that are composing the unique series keys
- Carries additional metadata information through observations, series and sibling level attributes
- Each dimension or attribute have conceptual meaning related to specific economics/statistics phenomenon
 - Each coded dimension or attributes are linked to corresponding code lists

Opportunities of a metadata rich environment

ICP data structure definition - ECB_ICP1

The high integration of the data disseminated in the EDP and SDW with the SDMX Information Model can be leveraged in order to make the search engine more effective and user friendly

new SDW and EDP Intelligent Search

 \odot

Elasticsearch: storing documents in an index

Logstash: used for processing documents e.g. from a database

Kibana: visualization tool for Elasticsearch index

SDW and EDP Intelligent Search

INPUTS: internal SDW or EDP Oracle database

FILTERS: both built-in both custom analyzers are used by IS, implementing different filters such as English possessive stemmer, English_keywords, Lowercase, Synonyms, English_stop, English_stemmer

OUTPUTS: Elasticsearch index

BOOSTING: reference series and series included in ECB publications are currently boosted

Currently the new search engine uses:

- Dimensions meaning
- Attributes meaning
- Metadata on dataset level
- Appearance in publications
- Tagging of the series in our custom build "SDW taxonomy" based on SDW economic concept navigation (SDMX concept scheme)

Features to be included In future releases:

 learning to rank, usage statistics, improvement of tags

EDP tagging process

Assigning meaningful key word to each disseminated series:

- Helpful for non expert users with no prior knowledge of DSD concepts/codification
- Used to improve the filtering of the search results
- More intuitive use of the search engine

NAVIGATION TAGS:

Assigned to time series based on the navigation hierarchy node (concept scheme SDMX IM) they are attached to

CODELIST TAGS:

Assigned to time series based on a meaningful codelist of the SDMX data structure definition

BUSINESS AREA DEFINED TAGS: Defined and customized by data producers

Conclusions

Data modelled via the SDMX Information Model can be integrated with novel search technologies to improve the searchability of economic data and metadata.

Thank you for your attention! Q&A
